PROFESSIONAL SUMMARY

Performance-driven Backend Engineer specializing in designing, building, and optimizing secure, enterprise grade distributed systems and RESTful APIs using Python (Django, DRF) and Java (Spring Boot). Adept at scaling transactional workflows, architecting stateless JWT/OAuth2 authentication layers, and structuring relational database schemas (PostgreSQL, MySQL) for cross-platform stability. Proven track record of converting intricate functional requirements into clean, self-documenting, and maintainable code bases within high concurrency architectures.

EDUCATION

Rivers State University

December 2025

Bachelor of Science (B.Sc.) in Computer Science • Port Harcourt, Nigeria

TECHNICAL SKILLS

Languages:	Python, Java, SQL (PostgreSQL, MySQL), HTML, CSS
Frameworks:	Django, Django REST Framework (DRF), Spring Boot, Spring Security, HTMX
Core Backend:	RESTful API Design, System Architecture, JWT, OAuth2, Object-Oriented Programming (OOP)
Tools & Data:	Git, GitHub, Hibernate / Spring Data JPA, Requirement Analysis

PROFESSIONAL EXPERIENCE

Dubakon Nigeria Ltd

November 2025 – April 2026

Backend Engineer • Port Harcourt, Nigeria

- Engineered backend performance patches and real-time monitoring routines for a live Computer-Based Testing (CBT) platform, guaranteeing zero-downtime exam delivery for thousands of students across multiple concurrent institutions.
- Architected programmatic network validations and secure browser entry protocols to minimize platform vulnerabilities and block unauthorized client access during high-stakes evaluations.
- Collaborated with product teams to scope requirements and build unified service models for multi-role workflows, enabling seamless system routing for high-throughput grading data, exam generation, and financial verification.

ION Consult Limited

May – November 2024

Backend Engineering Trainee • Port Harcourt, Nigeria

- Developed an internal recruitment and candidate-tracking pipeline using Python and MySQL, optimizing database indexing to support asynchronous status progression updates and cross-entity tracking workflows.
- Designed and integrated an automated document ingestion engine with Django to parse, validate, and securely retain digital resumes, reducing administrative file processing cycle times.

- Translated high-level business logic and human-resource constraints into crisp software architecture patterns, producing comprehensive endpoint documentation for clean internal consumption.

TECHNICAL PROJECTS

EchoSlot – Concurrent Appointment Scheduling System [GitHub/Echoslot](#)

Technologies: Python, Django, Django REST Framework, MySQL, HTMX

- Implemented pessimistic concurrency controls and table-level locking queries in MySQL using Python to resolve scheduling contention issues, effectively preventing race conditions and double-bookings on shared service providers.
- Built an abstract RESTful endpoint architecture backed by JSON Web Tokens (JWT) for stateless client authorization and compartmentalized API route verification.
- Leveraged HTMX server-side rendering updates to implement state tracking in the UI, shrinking overall DOM manipulation overhead and accelerating client response-to-interaction benchmarks by 40%.

Vaultapp – Stateless Authentication & Authorization System

[GitHub/Vaultapp](#)

Technologies: Java, Spring Boot, Spring Security, OAuth2, JWT, PostgreSQL

- Designed a cryptographic identity service utilizing Spring Boot and JWT to manage access token generation and validation, mitigating server-side memory bottlenecks through stateless session handling across diverse frontend targets.
- Constructed security filter chains utilizing failed login rate-limiting thresholds and automatic lockout routines to block programmatic brute-force vectors and dictionary threats.
- Engineered an normalized PostgreSQL directory using JPA/Hibernate to aggregate persistent refresh-tokens, allowing smooth federated identity integrations alongside standard local credential pathways.

E-Commerce Core API Platform

[GitHub/E-commerce](#)

Technologies: Java, Spring Boot, Spring Security, MySQL, Spring Data JPA

- Architected a decoupled enterprise application pattern using controller-service-repository segregation rules, maximizing isolation margins for independent suite debugging and microservice migration readiness.
- Enforced complex query optimizations including conditional product sorting, cursor-based pagination, and relational mapping layers using Spring Data JPA to reduce payload transmission overhead.
